**Catalog
Description:**

Laboratory course accompanying CLIM 101. This course uses hands-on exercises to teach students about the causes and impacts of climate change, as well as adaptation and mitigation. Students will learn how to find and interpret climate data, analyze data related to climate adaptation and mitigation, quantify inequities in incidence of climate hazards, and communicate the elements of the scientific inquiry process.

Justification:

What: There is an error in the course listing. This is a lab for CLIM 101 and needs to be changed to co-requisite rather than pre-requisite.

Why: This is preventing students from enrolling in both CLIM 101 and CLIM 103 concurrently.

**Does this course cover material which
crosses into another department?**

No

Learning Outcomes:

This course will:

1. Provide students with the tools to find and interpret climate-relevant data. By working with real-world datasets, students will learn how to find climate-relevant data from authoritative public sources like NOAA and NASA, as well as local data from county and municipal repositories. Students will learn how to access datasets, read documentation to interpret data, and import it into an analysis platform (e.g., spreadsheet software). By working with data from various sources, students will gain an appreciation for uncertainty and learn techniques for making decisions with incomplete or contradictory information.
2. Expose students to a range of responses to climate change. In this laboratory, students will be presented with data and simplified models of climate adaptation and mitigation. Examples include datasets of available renewable resources for a particular location and emissions inventories. Through this work, students will gain an appreciation for the data that is used in climate adaptation and mitigation studies. The laboratory will also provide a foundation for continued learning on how to interpret and synthesize adaptation- and mitigation-relevant data.
3. Introduce students to climate justice issues. The course will survey global and regional disparities of climate change impacts. Students will use sociodemographic and climate projections data to quantify inequities in incidence of climate hazards across and within countries using tools like the Climate and Economic Justice Screening Tool in the US and projections of global population change.

Will this course be scheduled as a cross-level cross listed section?

Specialized Course Categories:

Mason Core

Select the Mason Core Requirement the course is proposing to fulfill:

**Foundation
Courses:**

**Exploration
Courses:** Natural Sciences w/Lab

**Exploration
Courses:**

**Integration
Courses:**

Natural Sciences with Lab

Course must meet the following learning outcomes:

1. Understand how scientific inquiry is based on investigation of evidence from the natural world, and that scientific knowledge and understanding: a) evolves based on new evidence, and b) differs from personal and cultural beliefs
2. Recognize the scope and limits of science.
3. Recognize and articulate the relationship between the natural sciences and society and the application of science to societal challenges (e.g., health, conservation, sustainability, energy, natural disasters, etc.).
4. Evaluate scientific information (e.g., distinguish primary and secondary sources, assess credibility and validity of information).
5. Participate in scientific inquiry and communicate the elements of the process, including: a) making careful and systematic observations, b) developing and testing a hypothesis, c) analyzing evidence, and d) Interpreting results.
